TAXONOMY OF THE ORDER *MONONEGAVIRALES*: UPDATE 2018

A full list of authors and affiliations appears at the end of the article.

Abstract

In 2018, the order *Mononegavirales* was expanded by inclusion of 1 new genus and 12 novel species. This article presents the updated taxonomy of the order *Mononegavirales* as now accepted by the International Committee on Taxonomy of Viruses (ICTV) and summarizes additional taxonomic proposals that may affect the order in the near future.

INTRODUCTION

The virus order *Mononegavirales* was established in 1991 to accommodate related viruses with nonsegmented, linear, single-stranded, negative-sense RNA genomes distributed among three families [19, 20]. Today, the order includes 8 families [1, 2, 11, 21]. Amended/

Ethical approval

emended order descriptions were published in 1995 [5], 1997 [22], 2000 [23], 2005 [24], 2011 [6], 2016 [2], and 2017 [3]. In 2017, the Study Groups of the International Committee on Taxonomy of Viruses (ICTV) responsible for the taxonomy of the order and its 8 families assigned unclassified mononegaviruses to existing or novel taxa and continued efforts to streamline the order nomenclature in collaboration with other virus experts. Here we present the changes that were proposed via official ICTV taxonomic proposals (TaxoProps) at <http://www.ictvonline.org/> in 2017 and accepted by the ICTV Executive Committee (EC). These changes are part of the official ICTV taxonomy as of 2018.

TAXONOMIC CHANGES AT THE ORDER RANK

In 2018, no changes were made at the order rank.

TAXONOMIC CHANGES AT THE FAMILY RANK

Bornaviridae

The family *Bornaviridae* was expanded in 2018 by creation of a second genus (*Carbovirus*), including two novel species for the newly discovered jungle carpet python virus (JCPV) and southwest carpet python virus (SWCPV) found in carpet pythons (Pythonidae: *Morelia spilota*), respectively [10]. The previously established genus *Bornavirus* was renamed *Orthobornavirus* to remove the ambiguity of the terms “bornavirus”/“bornaviral” that resulted due to the creation of the second genus (in absence of the genus name change, “bornavirus”/“bornaviral” could refer either to all members of the family *Bornaviridae* or only to those of the genus *Bornavirus*). All binomial species names of the genus *Bornavirus* were adjusted by replacing the genus epithet “*bornavirus*” with “*orthobornavirus*” (TaxoProps 2017.005M.A.v1.Carbovirus and 2017.004M.A.v1.Bornaviridae_ren).

Filoviridae

The species name *Tai Forest ebolavirus* was changed to *Tai Forest ebolavirus* by removal of the diaeresis (TaxoProp 2017.001G.A.v2.43spren).

Mymonaviridae

In 2018, no changes were made at the family rank.

Nyamiviridae

In 2018, no changes were made at the family rank.

Paramyxoviridae

The genus *Avulavirus* was expanded in 2018 by the addition of six species (TaxoProp 2017.010M.A.v2.Avulavirus_6sp). The species *Avian avulavirus 14–16* were established for avian paramyxoviruses 14–16 (APMV-14–16) that were recently discovered in an unspecified duck in Japan, a white-rumped sandpiper (Scolopacidae: *Calidris fuscicollis*) in Brazil, and unspecified birds in South Korea, respectively [12, 27, 28]. The species *Avian avulavirus 17–19* were established for Antarctic penguin viruses A–C (APVA–APVC) that

were recently discovered in Antarctic long-tailed gentoo penguins (Spheniscidae: *Pygoscelis papua*) [18].

Pneumoviridae

In 2018, no changes were made at the family rank.

Rhabdoviridae

The genus *Ledantevirus* was expanded in 2018 by one species, *Kanywara ledantevirus*, for Kanywara virus (KYAV) recently discovered in an unclassified nycteribiid batfly in Uganda [8] (TaxoProp 2017.009M.A.v1.Ledantevirus_sp).

The genus *Lyssavirus* was expanded by the addition of two novel species, *Gannoruwa bat lyssavirus* and *Lleida bat lyssavirus*, for Gannoruwa bat lyssavirus (GBLV) and Lleida bat virus (LLEBV), recently discovered in Indian flying foxes (*Pteropus medius*) in Sri Lanka and in a Schreibers's long-fingered bat (*Miniopterus schreibersii*) in Spain in 2011, respectively [4, 9, 15] (TaxoProps 2017.013M.A.v1.Lyssavirus_sp and 2017.014M.A.v1.Lyssavirus_sp).

Finally, the genus *Tibrovirus* was expanded by one species, *Beatrice Hill tibrovirus*, for Beatrice Hill virus (BHV) discovered in 1984 in Australian biting midges (Ceratopogonidae: *Culicoides peregrinus*) [26, 29] (TaxoProp 2017.019M.U.v1.Tibrovirus_sp).

Sunviridae

In 2018, no changes were made at the family rank.

OUTLOOK

The taxonomy of viruses of the order *Mononegavirales* remains in flux and additional important changes are likely forthcoming. Indeed, in 2017, two additional taxonomic proposals that would affect the order *Mononegavirales* were debated during the most recent ICTV EC meeting in Singapore. TaxoProp 2017.006M.U.v2.Negarnaviricota proposes

- establishment of a phylum for negative-sense RNA viruses that is subdivided into two subphyla;
- establishment of a sister order to the order *Mononegavirales* to accommodate the recently discovered “chūviruses” [13, 25]; and
- combination of both sister orders in a class assigned to one of the subphyla.

TaxoProp 2017.016M.U.v3.Mononegavirales_rev proposes

- expansion of the family *Mymonaviridae* by 6 species for novel soybean leaf-associated viruses and an invertebrate virus [16, 17, 25];
- transfer of the nyamiviral genus *Peropuvirus* into a new family and expansion of the genus by 6 species for novel invertebrate viruses [13, 25];

- transfer of the free-floating genus *Crustavirus* into the family *Nyamiviridae*; the expansion of *Crustavirus* by two species for novel invertebrate viruses; and the expansion of *Nyamiviridae* by an additional three genera that include a total of five species for novel invertebrate viruses [13, 25];
- establishment of a new family that absorbs the previously free-floating genus *Anphevirus* and expansion of this genus by six species for novel invertebrate viruses [7, 13, 14, 25]; and
- dissolution of the previously free-floating genera *Chengivirus* and *Wastrivirus* and transfer of their species into the genus *Arlivirus*, expansion of *Arlivirus* by three new species for novel invertebrate viruses [13, 25], and transfer of this genus into a new family.

These two proposals failed to find unanimous approval at a final ICTV EC vote in fall of 2017 and were deferred to the 2018 ICTV EC meeting, at which a simple majority vote would suffice for approval of the original proposals.

SUMMARY

A summary of the current, ICTV-accepted taxonomy of the order *Mononegavirales* is presented in Table 1.

⁴Please note that viruses are real objects that are assigned to concepts that are called taxa. Species, genera, families, and orders are taxa. Taxon names are always italicized and always begin with a capital letter. Virus names, on the other hand, are not italicized and are not capitalized, except if the name or a name component is a proper noun. This column lists the virus names with their correct (lack of) capitalization.
